Perth’s bikeability scored as part of national initiative

In an Australian first, We Ride Australia has scored every Australian capital on the ability to travel by bicycle between local destinations with Perth scoring 42 out of a possible 100.

We Ride’s Executive Officer, Peter Bourke, led the Bicycle Transport Analysis (BTA) project in Australia.

“Perth has invested heavily in its principal bike network and Safe Active Streets in recent years which has been recognised, but a lack of infrastructure in the city centre itself makes the final stages of bike journeys higher stress, and this has impacted their score,” said Peter Bourke.

“Our objective is to enable cities and towns of all sizes everywhere to carry out basic network analysis for cycling and encourage them to build connected, convenient bike networks that we know encourage more short daily trips by bicycle,” Peter Bourke said.

“This has never been more important as many Australians have chosen to ride a bike during the COVID-19 pandemic because they felt safer with so little traffic on the roads.”

“Also, as we invest in COVID recovery, we mustn’t forget that people arriving at local shops by active transport spend more¹ and more local jobs are created² building bikeways than roads for the same amount of money,” said Mr Bourke.

The ratings system was developed by We Ride’s partners in the USA and uses open source, publicly available data. More than 650 North American, European and Australian cities have now been scored with Perth comparable to cities such as Detroit (41) and Philadelphia (43). The closest cities in Australia are Brisbane (40) and Adelaide (39).

The Bicycle Transport Analysis will be extended in 2021 and Local Governments wishing to participate in the program should contact We Ride Australia.
